

**Project 1:**

Feedback included a better interpretation of the clustering components and dimensionality reduction. Cluster 1 consists of politically violent countries with lower growth, GDP, education levels, and tradeshare. Cluster 2 consists of politically peaceful countries with higher growth, GDP, education levels and tradeshare.

**Project 2:**

Feedback included a more thorough interpretation of the coefficients of the linear regression and interpretation of the adjusted R-squared value. The only significant coefficient was the 'political\_violenceyes' coefficient with a p-value of 0.0282. The entire linear model accounted for about 4.0% of the variance in economic growth.
